

# Investigational sleep pad device increases deep sleep of midlife adults with insomnia symptoms: A randomized clinical trial

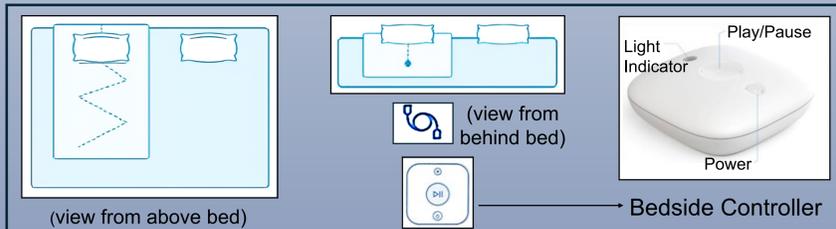

**PennState**

Margeaux M. Schade Ph.D. RPSGT, Victor Frolenko BS, David A. Reichenberger Ph.D.,  
Alexia Torres-Negron BS, Christa-Maria Ngam BS, & Anne-Marie Chang Ph.D.

## Background

- At least 34M adults in the US have insomnia.
- There is a need for nonpharmacologic, accessible insomnia treatments.
- This Proof-of-Concept pilot (NCT #05908344) evaluated a consumer-grade technology for effects on sleep and insomnia symptoms.

## Sleep Pad System

- US Patent #11147942 (Issued 10/19/2021)
- Fabric pad with embedded conductive wire that emits a radiofrequency gradient

## Methods

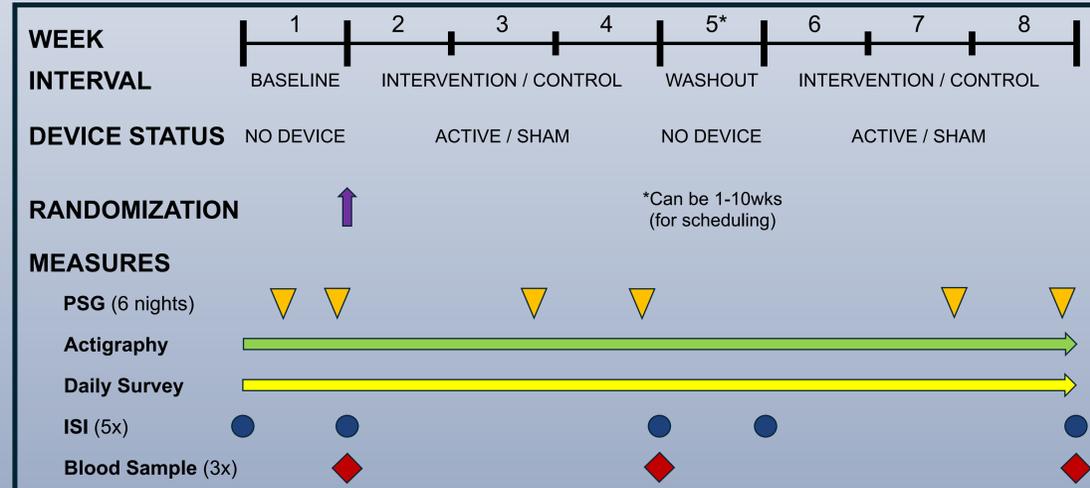

- Ten participants (40-65 years) with an ISI  $\geq 8$  provided data Sept 2023 – March 2024.

### Primary Outcomes:

- Insomnia Severity Index [ISI]
- Subjective Sleep Onset Latency [OL]
- Polysomnography [PSG]
  - Total Sleep Time [TST]
  - Sleep Quality [WASO]
  - Slow-Wave Sleep [NREM 3]

- Data collection for the primary outcomes occurred in participants' homes.
- Sham devices were identical to active devices except for emission of radiofrequency gradient.

## Randomized Double-Blind Crossover Protocol

## Results

### Active sleep pad improved NREM3 sleep relative to Sham

Treatment: Active (vs. Sham) sleep pad use  
Order: Randomized to Active first (vs. Sham first)

Bold p-values reflect significance (2-tailed;  $p < .05$ ).

<sup>~</sup>Estimates account for random intercepts, except where the random effect could not be estimated.

<sup>^</sup>Two participants missing ISI data were excluded.

<sup>#</sup>WASO data transformed (ln) for heteroscedasticity; reported table estimates were back-transformed.

|                    | OL (mins)                 | 10 | 20.3 (14.9)          | 15.7 (12.6)            | 24.9 (17.0)            |

Baseline Randomization Order comparisons were *ns*. No participants withdrew.

## Methods (cont'd.)

- ISI and OL were averaged within each segment and change from BL or WO was computed.
- PSG was scored by a blinded RPSGT, with Sleep Onset defined by Edinger et al. 2013<sup>1</sup>. One night from each segment was compared.
- Linear Mixed Effects Models (LMEM) with random intercepts estimated differences in outcomes between Active or Sham sleep pads.

## Conclusions

- NREM3 sleep was improved with Active sleep pad use relative to Sham, across 3 metrics:
  - A 36% increase in total minutes
  - A 42% increase in proportion of total sleep
  - A 72% decrease in the disruptions per hour
- No significant difference in insomnia symptoms
- The sleep pad may have implications for health outcomes associated with slow-wave sleep.
